Submitted (FEB-1997) to the EMBL/GenBank/DDBJ databases.
'- FUNCTION: BINDS TO VARIOUS KINDS OF NEGARIVELY CHARGED SUBSTANCES
SUCH AS HEPARIN, PHOSPHOLIPIDS, AND DEXTRAN SULFATE. MAY PREVENT
ACTIVATION OF THE INTRINSIC BLOOD COAGULATION CASCADE BY BINDING
TO PHOSPHOLIPIDS ON THE SURFACE OF DAMAGED CELLS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Q01339;

Genomics 15:335-42(1993).

-i- FUNCTION: THE B CHAIN OF FACTOR XIII IS NOT CATALLYTICALLY ACTIVE, BUT IS THOUGHT TO STABILIZE THE A SUBUNITS AND REGULATE THE RATE OF TRANSGLUTAMINASE FORMATION BY THROWBIN.

-i- SUBUNIT: TETRAMER OF TWO A CHAINS AND TWO B CHAINS.
-i- TISSUE SPECIFICITY: PREDOMINANTLY EXPRESSED IN LIVER AND KIDNEY.

Immunol. 153:4190-4199(1994).

TEUNCTION: C4BP CONTROLS THE CLASSICAL PATHWAY OF COMPLEMENT ACTIVATION. IT BINDS AS A COFACTOR TO C3B/C4B INACTIVATOR (C3BINA), WHICH THEN HYDROLYZES THE COMPLEMENT FRAGMENT C4B. IT ALSO ACCELERATES THE DEGRADATION OF THE C4BC2A COMPLEX (C3 CONVERTASE) BY DEGROLATING THE COMPLEMENT FRAGMENT C2A. ALPHA CHAIN BINDS C4B. IT INTERACTS ALSO WITH SERUM AMYLOID P COMPONENT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Hillarp A., Thern A., Danidaech b., Bovine C4b binding protein. Molecular cloning of the alphanaproteine C4b binding protein. Molecular cloning of the alphanaproteine complements are provided structural background for lack of complements.

                         FUNCTION: CA(2+) DEPENDENT RECEPTOR FOR MYELOID CELLS THAT BINDS
TO CARBOHYDRATES ON NEUTROPHILS AND MONOCYTES. MEDIATES THE
INTERACTION OF ACTIVATED ENDOTHELIAL CELLS OR PLATELETS WITH
LEUKOCYTES. THE LIGAND RECOGNIZED IS SIALYL-LEWIS X.
SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN
TISSUE SPECIFICITY: STORED IN THE ALPHA-GRANULES OF PLATELETS
AND WELLBEL-PALADE BODIES OF ENDOTHELIAL CELLS. UPON CELL
ACTIVATION BY AGONISTS, P-SELECTIN IS TRANSPORTED RAPIDLY TO
   INDUCTION: BY TUMOR NECROSIS FACTOR ALPHA

"Two genetic defects in a patient with complete deficiency of the b-
subunit for coagulation factor XIII.";
Blood 82:145-150(1993).

-i- FUNCTION: THE B CHAIN OF FACTOR XIII IS NOT CATALYTICALLY ACTIVE,
BUT IS THOUGHT TO STABILIZE THE A SUBUNITS AND REGULATE THE RATE
OF TRANSGLUTAMINASE FORMATION BY THROMBIN.

-i- SUBUNIT: TETRAMER OF TWO A CHAINS AND TWO B CHAINS.

-i- SUBUNIT: TETRAMER OF TWO A CHAINS AND TWO B CHAINS.

-i- SUBUNIT: DEFECTIVE WOUND HEALING, AND HABITUAL ABORTION.

-I- SIMILARITY: CONTAINS 10 SUSHI (SCR) REPEATS.

Example 6B; F1g 6B; 104pp; English.

This partial protein is found in clone pRRB9FH410 and represents a complement factor H related protein with homology to a region of the human tumour-associated complement factor H (CFH). The detection of this protein and a CFH antigen can be used in screening or for the treatment of renal or urogenital cancer, e.g. bladder, cervical or prostate cancer. Agents that may modulate this antigen could be used in the manufacture of a medicament for the treatment of a tumour cell.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This DNA encodes a protein having homology to human complement factor H, which plays a role in the immunological mechanism involving the complement reaction. The protein can also be used as an antigen for preparing antibodies against the protein The cDNA can be used as a probe for gene diagnosis and the gene for gene therapy, as well as for large-scale expression of the protein. The protein may also have immune stimulating or suppressing activity, haematopoiesis regulating activity, tissue growth activity, activin/inhibin activity, anti-inflammatory activity tumour inhibition activity, chemotactic/chemokinetic activity receptor/ligand activity, etc. The protein is identified by the presence of a hydrophobic N-terminal secretory signal region, knowledge of the protein function is not required, as in e.g. methods of expression
                                                                                                                                                                  region
                                                                                                                                                                                                                                                                                                   peptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New C4 binding protein fusion proteins and DNA encoding them comprise assemblies of C4bp monomers linked to functional moiety, e.g. AZT, useful as delivery vehicles in diagnosis and therapy Example 1; Fig 1; 105pp; English.

C This sequence was deduced from human hepatocyte (Hep G2) cDNA obtained following PCR amplification. The protein is a monomer containing 8 SCRs. Each SCR forms a looped domain due to the presence of two intradomain disulphide bonds (only the disulphide bonds of SCR8 are labelled in the Features Table). Within each SCR, the first cysteine residue bonds with the third and the second cysteine residue bonds with the furth. This secondary structure is responsible for the conformational flexibility of the C4bp monomer. The invention covers fusion proteins in which the monomer sequence, or a specified subfragment of it, e.g. having 5, 4, 3 or 1 SCR(s) is fused to the C-terminal of a protein such as a viral receptor, cell ligand, a bacterial, viral or parasitic immunogen, enzyme, so concerns fusion, etc. See also Q13243-51.

                                                                                                                                                                                                                                                                                                     The cDNA clone designated CR1-4 was described in J.Exp.Med.(1988) 168:1255-1270. It encodes the first 8 and a half amino terminal SCRs of CR1. The invention concerns analogues of "regulator of complement activation" proteins or truncated, hybrid or recombinant forms of them. CR1-4 is a preferred truncated form and a number of specified substitution variants of it are claimed in which certain positions in SCR-2 which have been identified as important for the degree of C3b- and C4b-binding are substituted by amino acids from the corresponding positions in SCR-9. The specification does not contain the CR1-4 sequence; the sequence given here was constructed from the full-length CR1 amino acid sequence having GENESEQ accession number R11810 and descriptions in the disclosure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CR1-4 (99H, 103E) analogue. short consensus repeat; regulator of complement activation; C3b binding; C4b binding; human complement type 1 receptor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         for diagnosis etc.

7 Claim 11; Fig 2 and R11810; 23pp; English.

7 Claim 11; Fig 2 and R11810; 23pp; English.

7 The cDNA clone designated CR1-4 was described in J.Exp.Med.(1988)

7 168:1255-1270. It encodes the first 8 and a half amino terminal

8 CRS of CR1. The invention concerns analogues of "regulator of

9 C complement activation" proteins or truncated, hybrid or recombinant

9 C complement activation proteins or truncated form and a number of

9 C complement activation variants of it are claimed in which certain

9 C specified substitution variants of it are claimed in which certain

9 C specified substitution variants of it are claimed in which certain

9 C specified substitution variants of it are claimed in which certain

9 C specified substitution variants of it are claimed in which certain

9 C specified substitution variants of it are claimed in which certain

9 C specified substitution variants of it are claimed in which certain

9 C specified substitution variants of it are claimed in which certain

9 C specified substitution variants of it are claimed in which certain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ragment of soluble human complement receptor 1 - useful for treating T-cell or B-cell mediated immune responses e.g. inflammatory responses such as rheumatoid arthritis Disclosure; Fig 1; 54pp; English.

This is an amino acid sequence of the human soluble complement receptor 1 (sCR1), useful in the treatment of T-cell or B-cell mediated immune responses. It is used to inhibit a T-cell or B-cell-mediated immune responses to prevent immune response-mediated tissue rejection and destruction or clearance or inactivation of an expressed protein especially from cells that have been treated by gene therapy to express the protein, e.g. dystrophin. The protein can also be used to inhibit a T-cell or B-cell-mediated inflammatory response,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               an interferon gamma secretory response, autoimmune response or neurological response, e.g. Alzheimer's or Parkinson's disease or multiple sclerosis. Also the protein can be used to treat systemic lupus erythematosus, rheumatoid arthritis, myasthenia gravis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Amino acid sequence of the soluble complement receptor 1 (sCR1). Membrane binding element; thrombotic disease; soluble protein; complement-related disease; integral membrane protein; inflammation; short consensus repeat; SCR 1-3; CRI; complement receptor type 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        membrane-binding elements (MBE) of low membrane affinity covalently associated with (I). MBE interact, independently and with thermodynamic additivity, with components of cellular or artificial membranes exposed to extracellular fluids. (A) are used to treat disorders treatable with (I) itself, specifically inflammation or any other complement-related disorder (e.g. neurological disease, graff rejection, myocardial infarction, sepsis, rheumatoid arthritis and many others; including application to indwelling devices) and thrombolytic disease, but also to treat allergy, induce weight loss, to treat ischaemia or asthma and as immuno-modulators for treating multiple sclerosis. (A) are administered orally, topically, by injection or inhalation at 0.01-10 (preferably of 1-10) memory of the sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            22-JAN-1998.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the transmembrane region. The proteins and fragments bind C3b and/or C4b, have cofactor activity and inhibit C3 and C5 convertase activity. In the sequence, x=untranslated region. This has 7 short consensus repeats (CR) of 4 long direct homologous repeats (CR) of 6 long direct homologous repeats (LHR) (see fig. 10 in patent). Deletion mutants, eg LHR-A for binding of C4b, and LHR-C for C3b binding, be made, and LHR-B and C can detect CR2 sequences. They are useful in diagnosing and treating immune disorders, and preven

CC The CDNA clone designated CR1-4 was described in J.Exp.Med.(1988)

CC 168:1255-1270. It encodes the first 8 and a half amino terminal

CC SCRs of CR1. The invention concerns analogues of "regulator of

CC complement activation" proteins or truncated, hybrid or recombinant

CC complement of them. CR1-4 is a preferred truncated form and a number of

CC specified substitution variants of it are claimed in which certain

CC specified substitution variants of it are claimed in which certain

CC specified of 3bb- and C4b-binding are substituted by amino acids from

CC degree of C3b- and C4b-binding are substituted by amino acids from

CC contain the CR1-4 sequence; the sequence given here was constructed

CC contain the CR1-4 sequence; the sequence having GENESED

CC accession number R11810 and descriptions in the disclosure.

Complement activation for the green of truncated, hybrid or recombinant of complement activation variants of it are claimed in which certain constitution variants of it are claimed in which certain degree of C3b- and C4b-binding are substituted by amino acids from the corresponding positions in SCR-9. The specification does not contain the CR1-4 sequence; the sequence given here was constructed accession number R11810 and descriptions in the disclosure.

Example 8; Page 18 and R11810; 23pp; English.

The cDNA clone designated CR1-4 was described in J.Exp.Med.(1988)

168:1255-1270. It encodes the first 8 and a half amino terminal

SCRS of CR1. The invention concerns analogues of "regulator of

Complement activation" proteins or truncated, hybrid or recombinant

complement activation proteins or truncated form and a number of

specified substitution variants of it are disclosed in which certain

specified substitution variants of it are disclosed in which certain

positions in SCR-5-6 are substituted by amino acids from

the corresponding positions in SCRs which are involved in C3b-

and

C4b-binding. The substitution variant given here has increased C3b-

the sequence given here was constructed from the CR1-4 sequence;

the sequence given here was constructed from the full-length CR1

amino acid sequence having GENESEQ accession number R11810 and

descriptions in the disclosure.
